

1. Write a java program to create base class vehicle with start engine and stop engine method . create subclasses car and motorcycle override the start engine and stop engine method in each subclass to start and stop the engine differently

CODE:

```
class Vehicle {  
    public void startEngine() {  
        System.out.println("The vehicle's engine is starting.");  
    }  
    public void stopEngine() {  
        System.out.println("The vehicle's engine is stopping.");  
    }  
}  
  
class Car extends Vehicle {  
    @Override  
    public void startEngine() {  
        System.out.println("The car's engine is roaring to life!");  
    }  
    @Override  
    public void stopEngine() {  
        System.out.println("The car's engine is shutting down.");  
    }  
}  
  
class Motorcycle extends Vehicle {  
    @Override  
    public void startEngine() {  
        System.out.println("The motorcycle's engine is starting up!");  
    }  
    @Override  
    public void stopEngine() {  
        System.out.println("The motorcycle's engine is turning off.");  
    }  
}
```

```

}

public class Main {

    public static void main(String[] args) {

        Vehicle myCar = new Car();

        Vehicle myMotorcycle = new Motorcycle();

        System.out.println("Car:");

        myCar.startEngine();

        myCar.stopEngine();

        System.out.println("\nMotorcycle:");

        myMotorcycle.startEngine();

        myMotorcycle.stopEngine();

    }

}

```

OUTPUT:

Output

Clear

```

^ java -cp /tmp/Q27CabRRK0/Main
Car:
The car's engine is roaring to life!
The car's engine is shutting down.

Motorcycle:
The motorcycle's engine is starting up!
The motorcycle's engine is turning off.

=== Code Execution Successful ===

```

2. Create a java program to generate abstract class A also class B Inherits class B Generates object for class B and display the text call me from B

CODE:

```

abstract class A {

    public abstract void displayMessage();

}

```

```

class B extends A {
    @Override
    public void displayMessage() {
        System.out.println("Call me");
    }
}

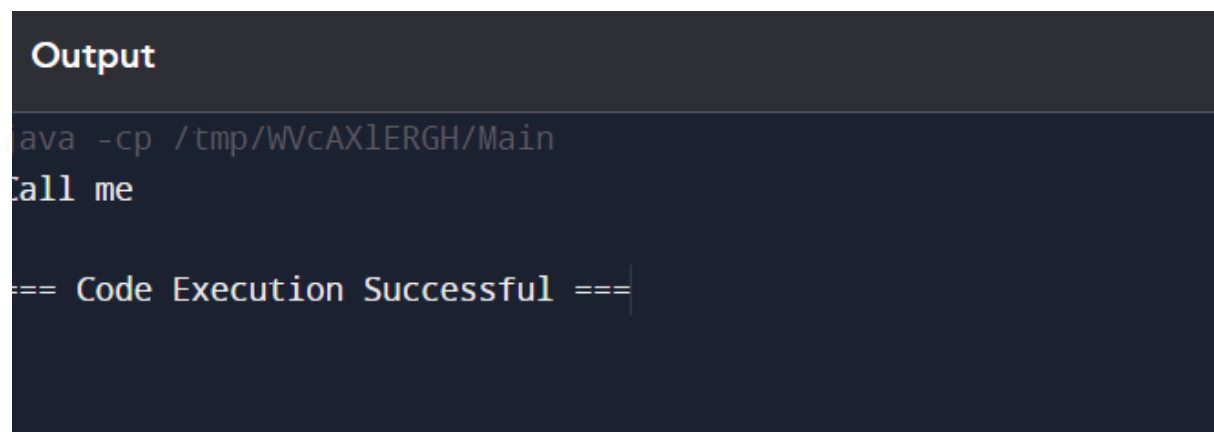

```

```

public class Main {
    public static void main(String[] args) {
        B b = new B();
        b.displayMessage();
    }
}

```

OUTPUT:

```

Output
java -cp /tmp/WcAX1ERGH/Main
Call me
=== Code Execution Successful ===

```

3. write a java program to generate abstract class A also class B inherits for class B generate object for class B and display the text call me from B

CODE:

```

import java.util.Scanner;

class OutOfRangeException extends Exception {
    public OutOfRangeException(String message) {
        super(message);
    }
}

```

```

public class Main {

    public static void checkAndSquare(int number) throws OutOfRangeException {
        if (number < 10 || number > 50) {
            throw new OutOfRangeException("Number out of range: " + number);
        } else {
            int square = number * number;
            System.out.println("The square of " + number + " is " + square);
        }
    }

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        System.out.print("Enter a number: ");
        int number = scanner.nextInt();

        try {
            checkAndSquare(number);
        } catch (OutOfRangeException e) {
            System.out.println("Exception: " + e.getMessage());
        } finally {
            scanner.close();
        }
    }
}

```

OUTPUT:

Output

Clear

```

java -cp /tmp/vJiEaoTj5c/Main
Enter a number: 34
The square of 34 is 1156

=== Code Execution Successful ===

```
